normalize

Generated MRI

 **Frozen encoder: RadioDINO-s16**
ViT-S/16 · 12 blocks · D=384

Pre-trained on **1.35 million radiology images** (CT, MRI and US) using DINO/DINOv2 self-supervision

block 1 → block 12

Read from **L4**, **L9** and **L12**

CLS feature

Features (post-hoc only)

1. Fidelity (block L12)

Do the generated images match the real distribution?

2. Memorization (block L9)

Does the model reproduce its training images?

3. Coverage (block L4)

Does the model cover the full variety of real images?

Layer-redundancy analysis

A CKA analysis of the same features examines whether the pre-specified blocks are non-redundant.
